Change Description

Over the next few months, Dometic will start production & transition to our updated 12K, 40K RV Furnaces, featuring advanced technology enhancements. New model numbers have been issued (see the table below). These updated models maintain the same installation footprint and thermostat compatibility as current Dometic furnaces.

Technology Enhancements

1. Onboard Soft Start Technology

Improved control board, up to 80% current reduction on start-up, no need for previous model's snap-action fuse installation. The reduced in-rush of current provides a quieter start-up compared to competitive furnaces.

2. Hall Effect Sensor (Patent Pending)

Our patent-pending, precision-engineered sensor is the first of its kind in the industry, providing a more accurate, dependable alternative to traditional sail switches. The automotive-grade Hall Effect Sensor is a more durable, debris-resistant solution. It eliminates snap action fuse installation step.

Transition Guidance

Before implementing the new furnace models, please ensure that all existing inventory of phased-out models is utilized. This approach helps minimize waste, control costs, and maintain operational efficiency during the transition period. Coordinate with your Sales account manager to plan usage and a smooth transition.

Dometic remains committed to innovation and quality, ensuring our customers receive the best heating solutions for their RVs.
